ABSTRACT

A method of making emergency telephone calls through the mobile
communications system to the nearest emergency service unit and the automatic
calling apparatus for making such call are provided, wherein the emergency call
is transmitted through a mobile communications network, and a list of useful
emergency service units with telephone numbers and area codes is kept by the
above apparatus. The emergency service units may be distributed across
different districts, and the automatic calling apparatus is still able to keep track of
the current location of the user dynamically through the regular line connection
with the mobile communications network and matching with a local area code.
When the emergency button is pressed, an emergency call will be sent out to the
nearest emergency service unit, thus the call-response time can be well
controlled for making a rapid response.
